

## Developing Back-End Apps with Node.js and Express Module 3 Cheat Sheet: Express Web Application Framework

Package/Method	Description	Code Example
	A dependency of	1. 1
Dependencies in `package.json`	express version between 4.0 to 5.0	<pre>1. "dependencies":{"express":"4.x"}</pre>
	will be declared as:	Copied!
new express()	Creates an express object which acts as a server application.	<pre>1. 1 2. 2  1. const express = require("express"); 2. const app = new express();</pre>
	·FF	Copied!
express.listen()	The listen method is invoked on the express object with the port number on which the server listens. The function is executed when the server starts listening.	<pre>1. 1 2. 2 3. 3 4. 4  1. app.listen(3333, () =&gt; { 2.    console.log("Listening at 3.    http://localhost:3333) 4. })  Copied!</pre>
express.get();	This method is meant to serve the retrieve requests to the server. The get() method is to be implemented with two parameters; the first parameter defining the endpoint and the second parameter is a function taking the request-handler and response-handler.  This method is	<pre>1. 1 2. 2 3. 3 4. 4 5. 5 6. 6  1. // handles GET queries to end point /user/about/id. 2. app.get("user/about/:id", (req,res)=&gt;{ 3.    res.send("Response about user " 4.    +req.params.id) 5. 6. })  Copied!</pre>
express.post(); express.use()	meant to serve the create requests to the server. The post() method is to be implemented with two parameters: the first parameter defines the endpoint and the second parameter is a function taking the request-handler and response-handler.  This method takes middleware as a	<pre>1. 1 2. 2 3. 3 4. 4 5. 5  1. // handles POST queries to the same end point. 2. app.post("user/about/:id", (req,res)=&gt;{ 3.    res.send("Response about user " 4.    +req.params.id) 5. })  Copied!  1. 1 2. 2 3. 3</pre>
ibout blank	parameter. Middleware acts as a gatekeeper in the same order that it is used, before the request reaches the get() and post()	4. 4 5. 5 6. 6 7. 7 8. 8 9. 9 10. 10

7/10/23, 12:46 AM about:blank

```
handlers. The order
                       1. const express = require("express");
                       2. const app = new express();
in which the
                       3. function myLogger(req, res, next){
middleware is
                       4.
                            req.timeReceived = Date();
chained depends on
                       5.
                            next();
the order in which
                       6. }
                      7. app.get("/", (req, res)=>{
8.    res.send("Request received at
the .use() method is
used to bind them.
                             "+req.timeReceived+" is a success!")
The middleware
                      10. })
myLogger()
function takes three Copied!
parameters, which
are request,
response, and next.
You can define a
method that takes
these three
parameters and
then bind it with
express.use() or
router.use(). Here,
you are creating
middleware named
myLogger and
making the
application use it.
The output
rendered includes
the time the request
is received.
Router-level
middleware is not
bound to the
application.
Instead, it is bound
to an instance
                       8.8
                       9. 9
of express.Router().
                      10. 10
You can use
                      11. 11
specific
                      12. 12
middleware for a
                      13. 13
specific route
                      14. 14
instead of having
                      15. 15
                      16. 16
all requests going
through the same
                       1. const express = require("express");
middleware. Here,
                       2. const app = new express();
                       3. let userRouter = expess.Router();
4. let itemRouter = express.Router();
the route is /user
and you want the
                       5. userRouter.use(function (req, res, next){6. console.log("User quert time:", Date());
request to go
through the user
router. Define the
                       8. })
router, define the
                       userRouter.get("/:id", function (req, res,
                      10.
                            next) {
middleware
                            res.send("User "+req.params.id+ " last
                      11.
function that the
                      12.
                            successful login "+Date())
router will use and
                      13. })
what happens next,
                      14. app.listen(3333, () => {
and then you bind
                            console.log("Listening at http://localhost:3333)
                      15.
                      16. })
the application
route to the router.
                     Copied!
                       1. 1
This is an example
                       2. 2
of static
                       3.3
middleware that is
                       4. 4
used to render
                       5.5
static HTML pages
and the images
                       1. const express = require("express");
from the server
                       2. const app = new express();
side. At the
                       3. app.use(express.static("cad220_staticfiles"))
application level,
                       4. app.listen(3333, () => {
                            console.log("Listening at http://localhost:3333")
the static files can
                       6. })
be rendered from
the
                     Copied!
cad220 staticfiles
directory. Notice
```

express.Router()

express.static()

about:blank 2/3
